

I. Amendments to the Specification

Kindly amend paragraph [0047], as follows:

[0047] Figure 4 shows a three sided mixing element angled with respect to the main direction of fluid flow only. In this particular figure, the main direction of fluid flow is parallel to the support member of the mixing surface. This support member could be a UV radiation source, such as are used in the disinfection of water or wastewater, or it could be any other member which is parallel to the direction of fluid flow. As shown, the first normal, the second normal, and the direction of fluid flow (discussed above) are in the same plane. ~~Another way of describing the orientation of the this surface is the non-planar relationship of the first normal, the second normal and the direction of fluid flow described above.~~
